The invention relates to an isolated polynucleotide comprising any one of C38043 cDNA sequences, appearing as ACH1789-ACH50831, whose sequence was C4 determined by the technique of SBH (sequencing by hybridisation). Also C4 included is a purified polypeptide comprising a sequence corresponding to a reading frame of the novel polynucleotide. The nucleic acid sequences cidentifying expressed genes or for physical mapping of the human genome, in forensics, in assessing biodiversities, or in identifying mutations cresponsible for genetic disorders and other traits. The nucleotide sequences are also useful as hybridisation probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisones DNA or RNA. The purified polypeptide is one of the 3043 isolated CDNA/EST sequences. Note: The sequence data for this patent did not form part of the printed specification, but was contained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotide sequences obtained from various cDNA libraries, useful as hybridization probes, as oligomers for PCR, for chromosome and gene mapping, in the recombinant production of protein, or in generating antisense DNA or RNA.
                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 12287; 44pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2003-615964/58.

                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                         The invention relates to cancer-associated proteins (CAP) and the cancer-
CC associated (CA) nucleic acids encoding them. The invention also relates
CC to a method for treating cancers involving administering to a patient an
CC inhibitor of CAP, and a method of screening for anticancer activity in a
CC potential drug involving providing a cell that expresses a CA gene,
CC contacting a tissue sample derived from a cancer cell with an anticancer
CC drug candidate and monitoring the effect of the anticancer drug candidate
CC on expression of the CA gene. The CAP proteins are useful for detecting
CC cancer associated with expression of a CAP protein in a test cell sample
CC and for screening for a bioactive agent capable of modulating the
CC cancer, involving determining the expression of a CA nucleic acid in a
CC cancer. This sequence represents a human CA gene of the invention. Note:
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC mosquito larvae, and so is highly useful in agricultural and medical CC fields. The gene cluster comprises the following genes: fscA, fscC, fscB, fscF, fscE and fscD, which code for modular polyketide synthase (PKS); CC fscFI and fscRII, which code for modular polyketide synthase (PKS); CC fscRIII and fscRIV genes which code for regulator proteins; fscRI, fscRII, CC codes for cytochrome P450 monoxygenase; fscFB which codes for ferredoxin CC protein; fscFE which codes for thiosesterase; fscMI which codes for protein; fscFE which codes for thiosesterase; fscMI which codes for CC glycosyltransferase; fscMII which codes for GDP-mannose-4,6-dehydratase; CC aminotransferase; fscMII which codes for GDP-mannose-4,6-dehydratase; CC fscO which codes for FAD-dependent monoxygenase; pabAB which codes for ADC CC lyase. The genes of the gene cluster of the invention can be used to CC develop recombinant microoxyganisms capable of producting FR-008 CC polyketides also to increase the productivity of the existing FR-008 CC polyketides or to produce new FR-008 polyketide variants, by its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                밁
                                                                                                                                                                밁
                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                              CC This invention is related to a novel isolated canine nucleic acid CC sequences and the construction of canine microarrays containing a CC significant portion of the canine genome. The isolated canine nucleic acid sequences of the invention may be useful for drug screening and containing the invention is therefore useful for assessing the coingact, including toxicity, of a compound, pharmaceutical agent or cenvironmental pollutant on a cell or living organism. The methods are useful for detecting genes that are up- or down-regulated in canines in a CC disease state. The sequences are useful as diagnostic agents or markers to detect a cellular response in a sample individually or as part of a gene expression profile. It is also useful as a target for agents that CC modulate gene expression or activity. The database is useful for producing electronic Northerns that allow the user to determine the cell type or tissue or cell. The methods are useful for determination of the abundance or expression level of a given gene in a compound or test agent will induce various specific compatible of a toxic response to one or more individual compounds. The methods are useful for determining the cell induced by a those of the toxins. The methods are also useful for predicting or elucidating the potential cellular pathways influenced, induced or that a teast one toxic response or the potential cellular pathways influenced, induced by the compound or test agent due to the similarity of the expression profile compound or test agent due to the similarity of the expression profile compound or test agent due to the similarity of the expression profile compound or test agent due to the similarity of the expression profile compound or test agent due to the similarity of the expression profile.
                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                         Query Match

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The method is useful for detecting SNP in FGF agene, which shows an association with the presence of the C-allele. The cancer is chosen from ocesophageal to cancer (sepecially ocesophageal CC and neck cancer. The ocesophageal cancer is cosophageal squamous cell ccl carcinoma. The present sequence is a Tagman PCR probe used to genotype individuals for the T SNP in the UTR of FGF-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        뭉

                                                                                                                                                                                                                                                                                                                                           S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC The present invention describes the use of an HIV Tat protein or polynucleotide, an HIV Nef protein or polynucleotide, or an HIV Tat CC polynucleotide, and HIV grotein or polynucleotide, or an HIV Tat CC and an HIV gp120 protein or polynucleotide in manufacturing a vaccine for CC and an HIV gp120 protein or polynucleotide in manufacturing a vaccine for CC entrance against HIV. The protein or polynucleotide is delivered via a CC bombardment approach. Also described: (1) a recombinant DNA molecule CC comprising a Nef and/or Tat and/or gp120 gene in a vector in which the CC comprising a Nef and/or Tat and/or gp120 gene in a vector; and (3) a kit C comprising a Nef and/or Tat and/or gp120 gene in a vector; and (3) a kit C comprising a Nef and/or Tat and/or gp120 gene in a vector; and (3) a kit C comprising at least two different vaccine compositions including: (a) a CC comprising at least two different vaccine compositions comprising particles, coated with recombinant DNA end or proteins are not CC and/or tat or nef/tat; and (b) a composition comprising gp120 and nef CC and/or tat or nef-tat DNA or proteins or polynucleotides are used to produce vaccines having anti-HIV activity. The recombinant DNA collecule can be used in manufacturing an HIV vaccine for the prophylactic or theraspeutic immunisation of humans. The present sequence represents an CC an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (YAC) vectors contain a reporter gene and transgenic mammals produced CC using them may be used to screen for an agent affecting nucleotide expression and gives easier monitoring of in vivo expression. The vector is used in the production of transgenic mammals for testing potential CC pharmaceutical or veterinary agents useful in treatment of disturbance of circadian function, sleep disorders, sating disorders, premenstrual CC syndrome, autoimmune disorders, birth defects in women and/or sexual CC disorders related to the expression pattern of a nucleotide such as those cC disorders related to the expression pattern of a nucleotide such as those above. The vectors have more concentrated YAC DNA, which allows better CC and more reliable gene transfer. The presence of a reporter gene allows ceasy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC easy monitoring of in vivo expression and the vectors allow for gene CC coverexpression (3-5 fold) and easy site determination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAC85227-50 are primers which were used to CC determine the size of the integrated YAC 35D8/D6 and YAC HSC78526/V12 CC constructs in a transgenic founder animal. The constructs were prepared CC from novel yeast artificial chromosome (YAC) vectors each of which CC comprises a centromere, two telomeres, at least one origin of CC replication, an internal ribosomal entry site (IRES), and a selection CC gene that is specifically removable from the vector. The resulting YAC CC are used to produce transgenic organisms for use in screening for agents CC that can affect the expression pattern of a nucleotide sequence of the transgenic organisms for use in screening for agents CC agents are potentially useful as pharmaceutical and veterinary agents for treating disorders of circadian function; sleep or eating disorders; CC premenstrual syndrome; autoimmune diseases; birth defects in women and/or CC exatual dysfunction, and also as lead compounds for developing agents with other activities. YAC can also be used for expression, regulation and/or CC compositions. The new vectors provide high YAC copy numbers and allow cast two yion) of the expression pattern of NOI; of the expression pattern of NOI; of the expression of the stream of the control of the care of a control of the part of more activities.
                                                                                                                                                                                                                                                                                                                                                                                                        Matches

```
The present invention relates to nucleic acid sequences that are complementary to particular genes, and can be used as probes for a crowaristy of analyses such as gene expression analysis. Each probe comprises 9 or more consecutive nucleotides from at least one of 14936 cumprises 9 or more consecutive nucleotides from at least one of 14936 cumprises 9 or more consecutive nucleotides from at least one of 14936 cumprises of a gene mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct cumulate acid probes. The array is useful in monitoring gene expression converted by hybridisation to a DNA library, in analysing genetic cuseful for identifying family members of a gene. The probes are also useful for identifying family members of a gene. The probes are also cuseful for identifying family members of a gene. The probes are also cuseful for identifying family members of a gene. The probes are also cuseful for identifying family members of a gene. The probes are also cuseful for identifying family members of a gene. The probes are also cuseful for identifying family members of a gene. The probes are also cuseful for identifying family members of a gene. The probes are also cuseful for identifying family members containing segments of DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC complementary to particular genes, and can be used as probes for a CC complementary to particular genes, and can be used as probes for a CC variety of analyses such as gene expression analysis. Each probe CC comprises 9 or more consecutive nucleotides from at least one of 14936 cm cleotide sequences defined in the patent, or their perfect sense match, CC sense mismatch, antisense match or antisense mismatch oligonucleotides. The probes may be used in an array comprising at least 10 distinct concleic acid probes. The array is useful in monitoring genetic concleic acid probes. The array is useful in monitoring genetic consecutions, and in hybridising tag-labelled compounds. The probes are useful for identifying family members of a gene. The probes are also cuseful in in situ hybridisations, in screening cDNA or genomic libraries consecutived subclones) for additional clones containing segments of DNA that have been previously isolated and sequenced, in Southern, northern, cc sequence of any gene or detect specific mutations in any gene, and in matched and sequences of the sequences of the invention are also useful as PCR primers. The invention provides a large collection of nucleic acid sequences confided the invention uses. CC complementary to particular genes with a wide range of analytical uses. CC complementary to particular genes with a wide range of analytical uses. CC directly from the USPTO web site at segdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                          Course of the invention for the multimerisation of minimal motifs. The course of the invention for the multimerisation of minimal motifs. The course of the invention for the multimerisation of minimal motifs. The course of the invention for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting core of the core protein a stabilising polypeptide of formula control or into the core protein a stabilising polypeptide of formula control of core protein a stabilising polypeptide of formula core residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr can do not not nepeat. Alternatively a nucleic acid encoding a stabilising core protein. The fusion proteins of the invention are more resistant to core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the core diseases, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel considered core protein for the treatment of inflammatory bowel conserved in protein which can activate nitro drugs in caryme/products can also be used in diagnostic methods such as in the fusion proteins can also be used in diagnostic methods such as in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of breast cancer comprising detecting the presence or absence of a polymorphic variation associated with breast cancer. The method of the invention demonstrates cytostatic activity and may be useful for identifying a risk of, preventing and/or treating breast cancer and cancer metastasis. The methods may be utilized for gene therapy or RNA interference. The current sequence is that of a PCR primer of the invention which was used to amplify a human HT014/LOC14902/LYPLA2 (lysophospholipage I)/GALE (galactose-4-epimerase, UDP-) DNA containing the polymorphic primer of the containing the property of the pr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            glycoproteins (HRGPs), repetitive proline-rich proteins (RPRPs) and arabino-galactan proteins (AGPs). Synthetic genes comprising a nucleic acid encoding the peptide (AAVISC67) can be engineered for the production of repetitive glycopeptide modules in cells. The invention provided a new approach to the problem of producing plant gums that is not dependent on environmental factors and greatly simplifies the production of a variety of naturally occurring gums as well as designer gums. Note: The present nucleotide sequence is indicated as a peptide sequence in the claims
                        The present invention describes synthetic genes encoding plant gums and other hydroxyproline (Hyp)-rich glycoproteins (HRGPs) and the nucleic acids that encode them. The nucleic acids, proteins and methods from the present invention may be used to produce HRGPs, repetitive proline-rich proteins (RPRPs) and arabinogalactan-proteins (AGPs) in plants via
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 30
                                                                                                                                                                                                                                       Nucleic acids and proteins useful glycoproteins in plants.

                                                                                                                              The present invention describes synthetic genes encoding plant gums and other hydroxyproline (Hyp) rich glycoproteins (HRGPs) and the nucleic acids that encode them. The nucleic acids, proteins and methods from the present invention may be used to produce HRGPs, repetitive proline-rich groteins (RPRPs) and arabinogalactan-proteins (AGPs) in plants via recombinant methodologies. Also described is the expression of synthetic genes designed from repetitive peptide sequences, such as glycoproteins (including the peptide sequences of gum arabic glycoprotein (GAGP).

The invention relates to an isolated polypeptide (I) comprising confidered by contiguous hydroxyproline residues and the non-rigid modules are directed by contiguous hydroxyproline residues and the non-rigid modules care synthetic gums based on motifs and repeats found in Gum arabic glycoprotein (GAGP), Hydroxyproline-rich glycoproteins (AGP). Also cincluded are a polypeptide (II) (comprising a first elastin module having a first crosslinkage motif, and a second elastin module flanked on the C-terminal side by a first extensin module having a first crosslinkage motif, and a second elastin module flanked on the C-terminal comprises at least two contiguous hydroxyproline residues and is crosslinkage motif. The crosslinkage motif comprises a flycoprotein having a first crosslinkage motif. The crosslinkage motif comprises at least two contiguous hydroxyproline residues and is crosslinkage motif. The crosslinkage motif comprises at leastin module hydroxyproline residues and is crosslinkage motif. The crosslinkage motif comprises tyrosine forms an intramolecular or intermolecular crosslink. In polypeptide (II), the rigid module crosslinkage motif is Val-Tyr-Lys. The tyrosine forms an intramolecular or intermolecular crosslink. In polypeptide (II), the crosslinkage motif is val-Tyr-Lys and contiguous hydroxyproline residues. CI is repeated three times. The first and/or second crosslinkage motifs crist elastin module is repeated six times and the second elastin module. CI is repeated three times. The first and/or second crosslinkage motifs crist elastin module. The nucleic acid is equence and an internal lysine rich region. The variant encoded by the first and the second elastin modules. The Le-AGP-1 crist elastine modules. The polypeptide (II) is useful as a thickener, emulsifier, stabiliser, the polypeptide (II) is useful as a thickener, emulsifier, stabiliser. The crossensus motifs or repeat units derived from GAGP, AGP, RPRP or HRGP crossent derived conservation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Plant gums (especially gum arabic) useful in the food and cosmetics industries are produced by expression of synthetic genes designed f the repetitive peptide sequences of plant gum glycoproteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ser-Hyp4 gene cassette oligonucleotide #7.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         27-JAN-2005
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADU09143 standard; DNA; 30 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sequence and an internal lysine rich region. The variant encoded by the nucleic acid further comprises an enhanced green fluorescent protein fusion glycoprotein. The nucleic acid is expressed in Nicotiana tabacum. The polypeptide (I) is useful as a thickener, emulsifier, stabiliser, surfactant, or flavour fixative in the food industry. It is also useful in cosmetics. The polypeptide (I) has an anomalously low viscosity. The present sequence encodes a consensus motif or repeat unit derived from GAGP, AGP, RPRP or HRGP.
                                                                                                                                                                                                                                                       muscular dystrophy primer used in the
                                                                                                                                                                                                                                                                                                       The present invention relates to plasmic change agents with cell differentiation activity containing protein TL4. These can be used in treatment, prevention and diagnosis of rhabdosarcoma, lelomyosarcoma,
                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Plasmic change agents and antibodies to them for diagr of tumours of muscle tissue and of muscular dystrophy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2002-674894/72

musculus CSTBLI/GJ (female) was obtained from the Jackson Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 0.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pND42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pW042 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|473214|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWH42 (gi |4732114 |gb|AF129072.1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /lab host="B. /clone lib="1119 - RescueMu Grid AA"
/note="Organ: leaf; Vector: RescueMu (engineered from
pBlueScript backbone); Site 1: BamHI; Site 2: BglII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.lastate.edu' and follow the links for
'RescueMu.' Grid AA was grown at UC San Diego in 2002. DNA
was extracted from leaf strips, double digested using
BamHI and BglII, and ligated to form circular plasmids.
DH10B cells were transformed and then screened on LB
plates with ampicillin."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pW042 (gi | 473214 | gb | ART29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

Vector DNA was prepared from a derivative of pWD42 (gi|473214|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA pollymerase and T4 pollymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The alaptored DNA was purified and size-selected for a 9.5 to approve the constant of the cons
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         musculus C57BL/6J (male) was obtained Laboratory Mouse DNA Resource

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNB42 (gi |4732114 |gb|AF129072.1), a copy-number inducable derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of phasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
